2016 Contract Fillers Guide

Replenish Bottling, creators of a new format for plastic spray bottles and containers turned to **R&D/Leverage** for its injection and mold building expertise to create reusable bottles designed for consumer mixing. The Replenish team required injection molds design for high-speed automation to produce six different parts used in an integrated, leak-proof bottle-interior reservoir design that would appeal to makers of a wide range of packaged goods. The bottle features an internal mixing cup that allows consumers to add concentrate into the bottle, which is then quickly mixed with household tap water.
